                                                                                                                                                                                                                                                                                                                                                                                    Br. J. Haematol. 89:762-770117537.

-i- FUNCTION: Probably plays an important role in the erythrocyte shape and mechanical properties.

-i- SUBUNIT: Oligomer. Interacts with the cytoplasmic SLC4A1/band 3 anion transport protein.

-i- SUBCELLULAR LOCATION: Membrane-associated (cytoplasmic cytoplasmic)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Human erythrocyte protein 4.2, a h is N-myristylated.";

PTM: Both cAMP-dependent kinase (CAPK) and another kinase present in the red-blood cells seem to be able to phosphorylate EPB42.

DISEASE: Defects in EPB42 are a cause of hereditary spherocytosis (HS) [MIM:17070], a hematologic disorder leading to chronic hemolytic anemia and characterized by numerous abnormally shaped erythrocytes which are generally spheroidal. Absence of band 4.2 associated with spur or target erythrocytes has also been

CATALYTIC ACTIVITY: Acetyl-CoA + 3 malonyl-CoA + NADPH methylsalicylate + 4 CoA + 3 CO(2) + NADP(+). PATHMAY: Patulin biosynthesis.
SUBUNIT: Homomultimer.
INDUCTION: In the late logarithmic growth phase.
SIMILARITY: Contains 1 acyl carrier domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         European Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                                                   FUNCTION: Band 4.2 probably plays an important role in the regulation of erythrocyte shape and mechanical properties. The major membrane binding for band 4.2 is the cytoplasmic domain of the erythrocyte anion transporter, band 3 (By similarity).
SUBCUNIT: Oligomer (By similarity).
SUBCULIULAR LOCATION: Cytoplasmic surface of erythrocyte membranes
                                                                                                                                                                                                                                     MISCELLANEOUS: The substitution site may be responsible for the of band 4.2.
                                                                                                                                                                                                                 SIMILARITY: Belongs to the transglutaminase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              chem.
